

# FIXID - Updated Glue

## 1. Upgraded German-Made Glue:

FIXID is an upgrade from our previous glue offered. Although it comes with a slightly higher price, the value is undeniable. It features an integrated brush in the lid, making the application process smoother and more efficient.

## 2. Flexible Application Options:

**The glue can be used either on its own or mixed with a special booster.** When combined with the booster, the glue's durability, heat resistance and UV resistance are significantly increased, making it ideal for more demanding repairs.

## 3. Mixing Ratio Guide:

The ideal mix is 5% booster to glue. This is best done in combining 100g of glue with 5g of booster. Precision is key, so we recommend using a scale for the best results.

**Important: After the repair is done and the glue has fully dried and hardened, it cannot be reactivated with heat again.** Please use max. 3% booster to glue, if you want to reactivate with heat to be able to remove the PVC again, i.e. when repairing Velcro's.

## 4. Application Recommendations:

The repair process is the same as usual. Apply the glue thinly to both adhesive surfaces. Let the glue dry completely and reactivate it with a heat gun. Then glue both sides together.

## 5. Usage Post-Mixing:

Once mixed, the glue is usable for about a day. Please remember to keep the container sealed when not in use to maintain its effectiveness.
