

Corrections to the book "Meteorology"

Utgåva 1, 2021

PAGE	CORRECTION
103	The arrows direction in the illustration is correct as below:
	
134	<p>The first paragraph of the text under the heading Terminal Area Forecast is changed to:</p> <p>A TAF always has a forecast validity period, which is usually 9 or 24 hours long in Sweden, depending on which airport it is. However, it may be shorter if the airport closes during the validity period of a normal TAF. This is because as a TAF is not allowed be active when the airport is closed. A new TAF, replacing the existing one, is issued and published every third hour. The issuance shall be made 30 minutes before the start of the validity period.</p>
141	<p>Bullet 14 is changed to:</p> <p>A TAF is a weather forecast that is issued for major airports. It is valid for 9 or 24 hours and is updated every third hour.</p>
