

# ISOLINA FLAX INSULATION CUTTING INSTRUCTIONS

Larger volumes:

For best results, cut products with a straight (toothless) bladed band-knife. Alternatively, clamp insulating material between boards and cut to required size or shape with an angle grinder fitted with a disc for metal cutting purposes of appropriate diameter (without teeth, no segmented diamond disc).

For smaller volumes:

By means of the [special handsaw](#) that finally makes the manual cutting of all flax products a breeze. It is both inexpensive and durable.

Really small amounts of thin insulation products can be cut with a general wavy blade insulation knife or simply by hand with ordinary scissors.

**TIP:** Fewer seams mean better overall insulation results; shapes perfectly fitting the space of installation can be cut in one piece.
